Microfiber Cloths

Colour-Coded for Safety

Colour-coding microfiber cloths is essential in preventing cross-contamination. Designating a colour to specific cleaning tasks is industry best-practice to ensure bacteria and pathogens don't spread. Use the below as reference when colour-coding your microfiber cloths:

Blue

- Windows
- Mirrors
- Doors
- Hallways

Red

- Toilets
- Urinals
- Hazard Areas

Green

- General Areas
- Tables
- Desks
- Kitchens

Yellow

- Dry Dusting
- Polishing

Why can't I use the same colour cloth for everything?

Preventing cross-contamination isn't the only reason to colour-code. It's crucial in showing that cleaning isn't just being done - it's being done right.

Imagine this: a visitor sees cleaning staff use a red cloth in a washroom and to clean a water fountain. The visitor has no way of knowing if the cloth was changed between tasks and may assume it's the same one. This could escalate into a complaint that affects visitor satisfaction and well-being.
